

DIAMOND SEA-GLAZE WINDOW AND DOOR FINISHES

See Compare Products in the Products section for available finishes.

See the Standard Powdercoat and Paint Colours document for available colours.

We offer the following finishes:

ANODIZING: Many of our aluminum window extrusions are pre-anodized and we also offer outsourced clear anodizing. This is one of the toughest finishes available. The aluminum's natural oxidation process is enhanced by adding electricity and chemicals. This process produces a transparent anodic coating that is integral with the aluminum so it will not chip, peel or flake.

POWDER COATING: This dry finish process offers excellent exterior weatherability. The electrostatically charged powder, made up of ground pigment and resin, is sprayed on the electrically grounded parts. This holds the powder in place until it is melted in an oven creating a smooth, tough coating.

WET PAINT: The Wet Paint process offers a long lasting, high gloss finish. Polyester Urethane paints are applied with a spray gun and then allowed to cure. This causes the product to solidify and adhesion to improve.

MILL FINISH: This is bare metal with no protective coating. This finish will oxidize naturally.
